

Arbor Order Manager

Overview

Order Manager (OM) provides a clear and detailed one-page view of all orders associated with funds that exist within Arbor. Orders can be generated and sent electronically via the Financial Information eXchange (FIX) or an Excel feed using Bloomberg EMSX API, configured to simply receive fills coming from an order generated by a third party Execution Management System (EMS), or manually entered for those brokers not available on the FIX network.

OM can easily generate single, allocated, and block orders based on an assortment of different classifications. For example, orders can be based on

- Target Exposure
- Target % of NAV
- % of Current Position

BUY-1,833,367 'AQUARIUS PLATINUM LTD'

Bid - 8.9000 Ask - 8.9000 Last - 8.9000 Volume - 0 CCY-GBP

Order Summary

Product ID	Account	Cum %	Broker	Custodian	Calc. Qty	Fund
AQP LN Equity	123456Fund1	28.6524	GSLN	GSI	525304	Fund1
AQP LN Equity	123456Fund3	100.0000	GSLN	GSI	1308063	Fund3

This capability allows investment ideas to be quickly entered and sent to market. Users can specify price limits, expiry, and if supported by the broker, algorithmic trading and 'Care Of and On Behalf Of' orders. All order details including book or strategy can be entered at this point, preventing double-keying when the order is converted into a trade. Further, orders can be entered individually or in a block.

Pre/Post-Trade Compliance

When connected to real time market data, orders generated within OM can be checked against predefined compliance rules using the latest information available. These pre-trade compliance rules can also be set as post-trade compliance rules.

Further, Arbor can run a post-trade compliance engine in the background against static or real time market data, and when rules are breached, users can be warned via e-mail or an on-screen alert. (*More details can be found in Compliance Rules*)

Allocation Rules

OM also allows for the addition of user defined trade allocation rules. The user defines the rule name and description, links the rule to specific accounts or brokers, and determines what the allocation is to be based on (% , % NAV or % GAV).

There is an additional feature that allows the user to determine what to do if an allocation ends with an unequal quantity spread. The user can select to have the leftover quantities randomly placed into the funds, or the leftover quantities can be placed according to the user's pre-determined choosing.

Add Trade Allocation Rules

Rule Name: Allocation Equity Linked To: Broker Allocation Based On: % Randomize

Rule Description: EQ Split Link ID: MS Base Value: [] Yes No

Fund Name	Custodian	Account	Split %	Book	Strategy	
Fund1	MSIL	Test	60			Delete Split
Fund3	MSIL	123456Fund3MSIL	40			Delete Split

Add Split Add Rule Refresh Delete Rule Reset

Manual Orders

OM can still be used effectively with users who are not connected to the FIX network, as orders can be entered and filled manually. This allows users to still take advantage of pre-trade compliance rules. Orders processed this way are subject to all the same logging so that investors can see the full life-cycle of the order. Once the order is filled, users enter the quantity and price and it is processed directly into a trade for reporting and clearing.

Approval

OM can also be configured to allow users a “4 eyes” approval stage. Different entitlement levels can be set at the user level to both set up/manage compliance rules and give the ability to approve orders. Users can also have entitlements to approve their own orders or to only approve other users’ orders.

Action	Version	User	Time	Comments
1 - 600 'SMTPC FP Equity'	0	Steve.Nguyen	3/26/2015 12:16:58	Order Entered
			3/26/2015 12:16:59	Compliance Check Passed

Fill 2 - 300 @ 25.0000		Steve.Nguyen	3/26/2015 13:08:20	802_3

Proposed Position Reporting

OM allows users the ability to quickly see a ‘proposed portfolio,’ where the proposed orders are filled and cash positions are adjusted. Users can submit orders to the proposed portfolio (without sending to market) to allow visualization of a proposed order or strategy.

Connected to third party market data, the proposed portfolio will show real time P&L, allowing the real portfolio to be easily compared against the proposed portfolio.

Proposed orders are highlighted in gray.

From here, the order(s) can simply be approved and sent to market. Each step in the order lifecycle is logged directly inside the order. OM stores times, user IDs, compliance status, approval status and previous versions of the order.

Individual fill prices, quantities and times are also stored, allowing OM to calculate the average price and time to complete the order.

For illiquid orders, users can easily allocate the order at any time, creating a trade from the filled quantity to report for clearing while simultaneously creating a new order with the remaining quantity. This reduces having to repeatedly enter the same information.

Portfolio Rebalancing

Because OM is directly linked to the Portfolio Manager, users can quickly and easily rebalance their portfolios based on cash inflows and outflows. From the Portfolio Rebalancing page, users can choose to rebalance their exposure exactly or chose to exclude certain lines and redistribute the cash flow over the remaining balance. *(More details can be found in Portfolio Rebalancing)*
